Who are we?

- Our aim is to improve public mental health with Adaptive technologies (ICT) and psychological treatments.
- Team of Domain experts, Software Engineers, ML engineers, HCI engineers and Industry.

INTROMAT

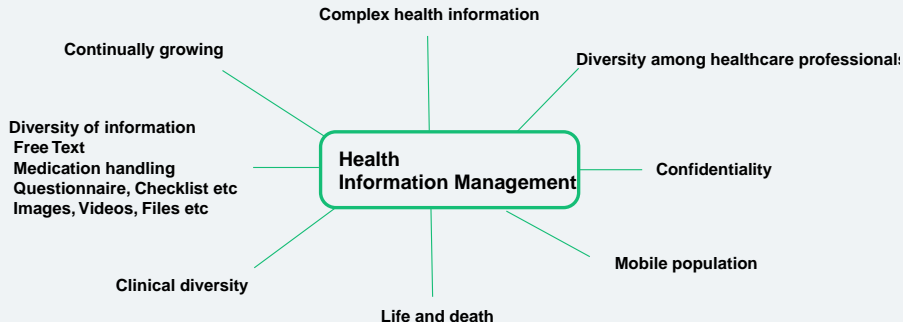

Høgskulen
på Vestlandet

(HVL)

Why is Health Information(HI) management so hard?

Why do we need to structure HI?

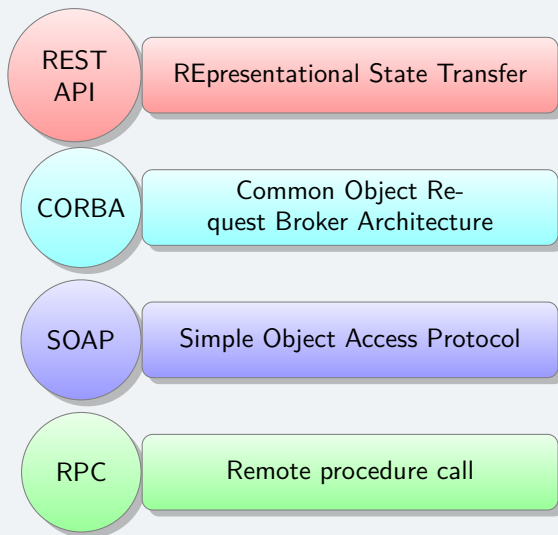

- Avoid repetitive data entry
- Retrieval and overview
- Reuse of record info
- **For technical integration**
- **For information exchange**
- Clinical decision support
- Quality indicators
- Management data

How can we structure HI?

By using of consistent standards defining syntactic and semantic meaning of information being exchanged.

Health Information Interchange

Issues with RESTful API

- Query Complexity
- Overfetching
- Under-fetching and $n+1$ request problem
- Modifiability
- API versioning

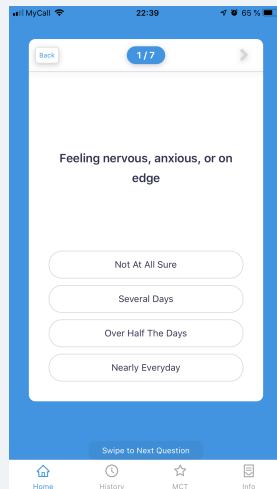

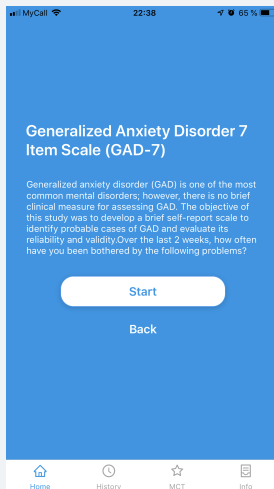

RESTFul approach - Patients

- Base URL: <http://hapi.fhir.org/baseDstu3>

GET	/Patient	All Patients
POST	/Patient	Create Patient
GET	/Patient/649227	Single Patient
PUT	/Patient/649227	Update Patient
DELETE	/Patient/649227	Delete Patient

- <https://www.hl7.org/fhir/resourcelist.html> lists 143 HL7 FHIR resources.
- Assuming **Best Case**, each resources needs 5 endpoints (CRUD) resulting ($143 \times 5 = 715$) endpoints.
- **Worst Case**: Custom endpoints based on custom requirements. Eg. all patients over 30 years, all patients only from Bergen etc.

Self Assessment App

1. (name, description), 2. (name, description, title), 3. Question and options

Response From REST - Overfetching

API versioning

How Does Web Service API Evolution Affect Clients?

4 Author(s) Jun Li ; Yingfei Xiong ; Xuanzhe Liu ; Liu Zhang [View All Authors](#)

13 Paper Citations 769 Full Text Views

Abstract:
Like traditional local APIs, web service APIs (web APIs for short) evolve, bringing new and improved functionality as well as incompatibilities. Client programs have to be modified according to these changes in order to use the new APIs. Unlike client programs of a local API, which could continue to use the old API, clients of a web API often do not have the option not to upgrade, since the old version of the API may not be provided as a service anymore. Therefore, migrating clients of web APIs is a more critical task. Research has been done in the evolution of local APIs and different approaches have been proposed to support the migration of client applications. However, in practice, we seldom observe that web API providers release automated tools or services to assist the migration of client applications. In this paper, we report an empirical study on web API evolution to address this issue. We analyzed the evolution of five popular web APIs, in total 256 hanged API elements, and carefully compared our results with existing empirical study on API evolution. Our findings are threefold: 1) We summarize the API changes into 16 change patterns, which provide grounded supports for future research, 2) We identify 8 completely new challenges in migrating web API clients, which do not exist in the migration of local API clients, 3) We also identify several unique characteristics in web API evolution.

[Authors](#)

- the requirements of clients are often dynamic.
- can modify the existing endpoints or create endpoints to only fetch required resources. BUT requirements changes quickly.
- modification quickly becomes inflexible as one need to think about how to support existing customers while providing new functionality.

Our solution

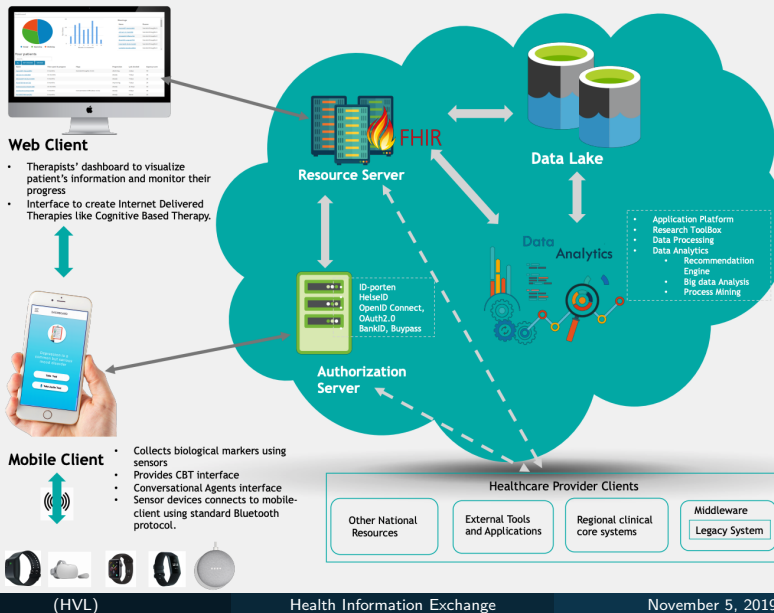

GraphQL

GraphQL developed by Facebook and has been embraced users including Coursera, GitHub, Pinterest, Neo4J, PayPal and others.

Prototype

Architecture Centric Development (ACD)

Mapping HL7 FHIR resources to GraphQL schema

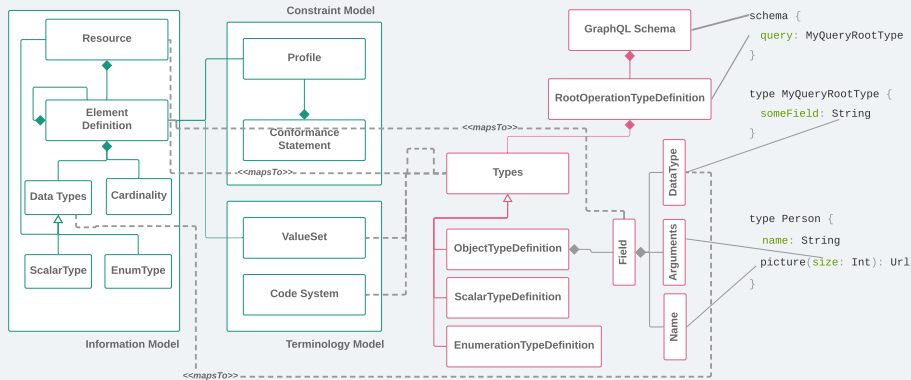

Algorithm 1: Mapping HL7 FHIR resources to GraphQL schema

Input: HL7 Resource

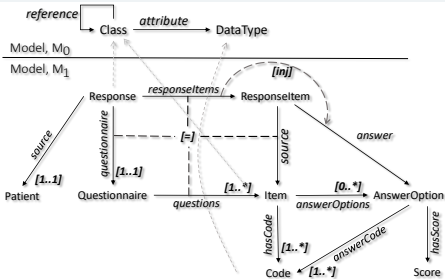

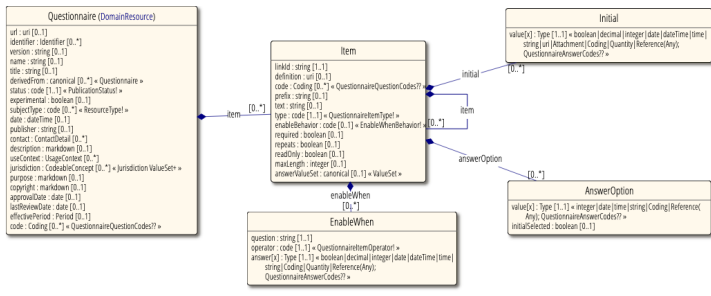

Output: GraphQL Schema

```
1 function recursive_hl7fhir_graphql_mapper (Resource)
2   schema = {};
3   foreach field ∈ HL7 Resource.fields do
4     switch Resource.field do
5       case field.Type is ScalarTypeDefinition do

Mapping HL7 FHIR with GraphQL schema

Case Study - Questionnaire

Schema Definition

```
type Questionnaire {
  resourceType: String
  url: String
  identifier: [Identifier]
  version: String
  name: String
  title: String
  status: statusEnumType
  experimental: Boolean
  publisher: String
  description: String
  item: [QuestionnaireItem]
}
```

```
type Identifier {
  system: String
  value: String
  use: identifierEnumType
}
```

```
type QuestionnaireItem {
  linkId: String
  prefix: String
  text: String
  type:
    QuestionnaireItemTypeEnum
  required: Boolean
  answerValueSet: [ValueSet]
}
```

```
type ValueSet {
  resourceType: String
  url: String
  identifier: [Identifier]
  version: String
  name: String
  title: String
  status: statusEnumType
  experimental: Boolean
  publisher: String
  description: String
  compose: Compose
}

type Compose {
  inactive: Boolean
  include: [ComposeInclude]
}

type ComposeInclude {
  concept: [
    ComposeIncludeConcept
  ]
}

type ComposeIncludeConcept {
  code: coding
  display: String
  extension: [Extension]
}
```

```
type Extension {
  uri: String
  valueDecimal: Float
}

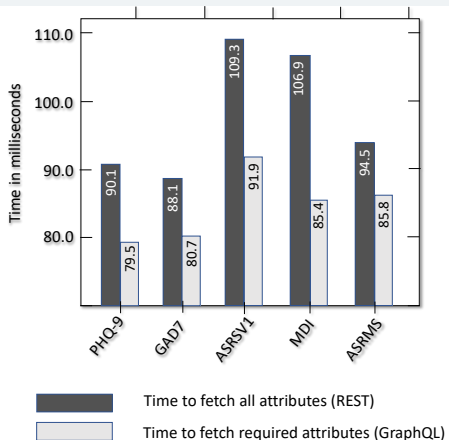

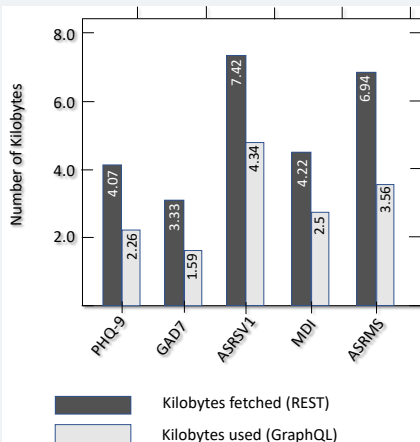

enum statusEnumType {
  draft
  active
  retired
  unknown
}

enum identifierEnum {
  usual
  official
  temp
  secondary
  old
}

enum TypeEnum {
  group
  display
  boolean
  decimal
  integer
  date
  dateTime +
}

type Query {
```

Evaluation of Response size and Time

Throughput and response time with RESTful approach

Fig. 4: Concurrent users and number of hits per second when fetching all the available attributes from the Questionnaire

Fig. 5: Concurrent users and response time (milliseconds) when fetching only the required attributes from the Questionnaire

Throughput and response time with GraphQL

Fig. 6: Concurrent users and number of hits per second when fetching only the required attributes from the **Questionnaire**

Fig. 7: Concurrent users and response time (milliseconds) when fetching only the required attributes from the **Questionnaire**

Performance Test statistics

Description	All attributes	Required Attributes
Average Throughput	100.6 hits/second	157.7 hits/second
Average Response Time	484 millisecond	308 millisecond
Test Start time	Mon, 06/03/2019 - 11:24	Jun 03, 2019, 10:58:29 AM
Test Stop Time	Mon, 06/03/2019 - 11:44	Jun 03, 2019, 11:18:54 AM
Time Elapsed	20 minutes	20 minutes
Concurrent Users	50	50

Table 1: Performance test meta-data for fetching GAD-7 Questionnaire resource. Column 1: description of the meta data, column 2: meta data for fetching all attributes from the endpoints. column 3: meta data when fetching only required attributes

- Throughput :average number of HTTP/s requests per second generated by the test
- Response Time: average amount of time from first bit sent to the network card to the last byte received by the client.

Challenge: Circular relationship complexity

```
type ThreadDefinition {
  title: String
  text(first: Int, after: String): [
    MessageDefinition]
}

type MessageDefinition {
  text: String
  thread: ThreadDefinition
}

type Query {
  thread(id: ID!): ThreadDefinition
}
```

```
query complicatedQuery {
  thread(id: "ID") {
    text(first: 100000) {
      thread {
        text(first: 100000) {
          thread {
            # ...repeat 100000 (n) times
            ...
          }
        }
      }
    }
  }
}
```

Challenge: Schema Duplication

- schema definition based on the choice of the database being used (this project uses mongoDB, so schema are based on mongoose ¹);
- schema definition for a GraphQL endpoint.
- Good thing is community is already aware of both issues. And there are solutions being worked out currently.

¹<https://mongoosejs.com/>

Future Directions

- Schema Stitching or Schema federation to promote interoperability between current health systems and legacy systems.
- Creation of adaptive Internet-Delivered Psychological Interventions (IDPT) using GraphQL based HIE.
- Create a comprehensible dashboard for better visualization for therapists.
- Further research in both development of Adaptive system and clinical trials are required.

Conclusion: ISO/IEC 25000.ISO/IEC 25000:2005

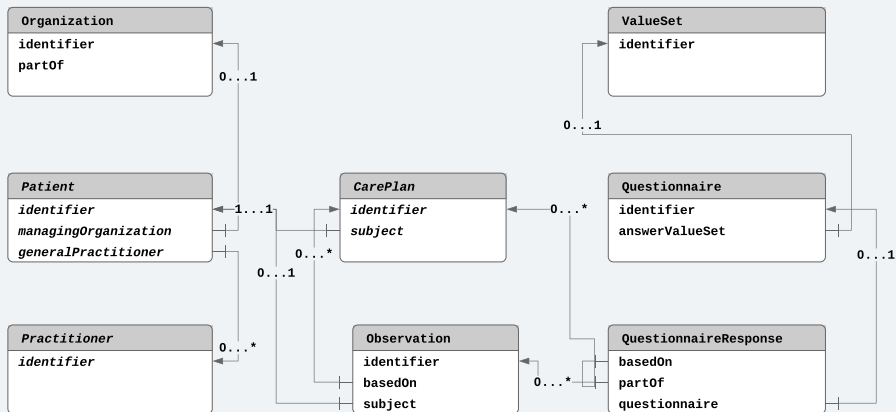

- Interoperability ✓ HL7 FHIR
- Security ✓ SMART on FHIR
- Modifiability ✓ SOA-Oriented architecture, GraphQL
- Scalability ✓ SOA-Oriented architecture
- Testability ✓ TDD Approach

Thank You

HL7 FHIR ER Diagram

How does GraphQL work?

What is a resolver?

A resolver is a function that resolves a value for a type or field in a schema. If an Object is returned, execution continues to the next child field. If a scalar is returned (typically at a leaf node), execution completes. If null is returned, execution halts and does not continue.

Executing queries

- **Parse:** A query is parsed into an abstract syntax tree (or AST).
- **Validate:** The AST is validated against the schema. Checks for correct query syntax and if the fields exist.
- **Execute:** The runtime walks through the AST, starting from the root of the tree, invokes resolvers, collects up results, and emits JSON.
